15 JURY TRIAL

* *

18 On the 10th day of January, 2012, the following
19 proceedings came on to be heard in the above-entitled
20 and numbered cause before the Honorable John K. Dietz,
21 Judge presiding, held in Austin, Travis County, Texas:

1 that the full picture of all the evidence has been
2 presented to anyone.

3 The defendants executed their plan over
4 many years, and now my co-counsel, Mr. Melsheimer is
5 going to reveal the details of the plan to you. But
6 throughout this trial, one fact will be familiar to you,
7 and that is the motivation behind Johnson & Johnson's
8 conduct. It's a simple motivation, and it's one that
9 we've all grown far too familiar with in recent years.
10 It is money and its frequent companion, greed.

11 MR. MELSHEIMER: May it please the Court,
12 good morning. I'm Tom Melsheimer. During my time with
13 you today, I want to review what I expect the evidence
14 will show in this trial. The gist of it is this:
15 Janssen, a subsidiary of Johnson & Johnson, engaged in a
16 wide-ranging fraudulent scheme to market and sell
17 Risperdal, a drug that was no better and in some ways
18 worse than older less expensive antipsychotic
19 medications.

Over the course of 17 years, Janssen sold \$34 billion worth of Risperdal at a profit margin of sometimes nearly 97 percent. At times, the company sold \$350,000 worth of Risperdal every hour. You'll see this in their documents.

How did they accomplish this? Four ways.

1 First, they made false statements about Risperdal being
2 better than the older less expensive medications,
3 including helping fund and manipulate treatment
4 guidelines, treatment guidelines that made Risperdal
5 appear to be better than the older drugs. And included
6 in this scheme was a scheme to pay Texas officials to
7 promote Risperdal for Janssen's own benefit at the
8 expense of their duties to the state of Texas.

9 Number two, Janssen illegally promoted
10 Risperdal for use in children even though the FDA had
11 told them that they could not do that.

12 Three, Janssen made false claims that
13 Risperdal was safer than the older less expensive
14 medications, including minimizing serious side effects
15 like hormonal side effects and diabetes.

16 And finally, number four, Janssen made
17 false claims that Risperdal was more cost effective than
18 the older less expensive medications.

19 Janssen's fraudulent scheme violated the
20 Texas Medicaid Fraud Prevention Act. We're here today
21 in this courtroom to present evidence of those
22 violations. And at the end of this trial, you will
23 conclude that Janssen has violated this statute and
24 other laws.

25 Now, it turns out that part of your work

1 is already done. In 2004, the Food and Drug
2 Administration caught Janssen making some of the same
3 false claims you will hear about in this trial. In
4 response, the FDA made Janssen send out this letter to
5 over 600,000 healthcare professionals, including 18,000
6 in Texas.

7 In this July 21st, 2004 letter that
8 Janssen sent out, they said as follows: They said that
9 the FDA warning letter had concluded that Janssen had
10 omitted material information about Risperdal, had
11 minimized potentially fatal safety risks and made
12 misleading claims suggesting superior safety.

13 Now, you may hear during this trial that
14 the defendants don't believe they did anything wrong.
15 But folks, the Food and Drug Administration wasn't the
16 only group back in 1994 who thought Janssen had given
17 out false and misleading information. It turns out
18 Johnson & Johnson executives thought so, too.

19 Let's take a look at this slide from
20 Dr. Scott Reines. It's an e-mail. He's an executive
21 vice president with J&J and a medical doctor. And in
22 April of 2004, he sent out an e-mail to folks within the
23 company about this letter, this false and misleading
24 letter that Janssen had sent out. What does he say? He
25 says, first, "They never consulted the team or anyone in

1 PRD." PRD is the research arm of Johnson & Johnson.
2 "No competent person would have let it go out. It's
3 really a black mark for J&J." That's what Dr. Reines
4 said in 2004, and I think it's going to be a little bit
5 different from the story Janssen will tell you in this
6 trial.

7 When Janssen received this warning letter
8 and was forced to tell all these doctors of their
9 misleading statements, it was pretty serious stuff. It
10 was especially serious for a company like Janssen which
11 had a corporate motto that said that "We believe our
12 first responsibility is to the doctors, nurses and
13 patients, to the mothers and fathers" of all who use our
14 products. In other words, their credo says we're going
15 to put patient first, not profits. Folks, at the end of
16 the evidence, I think you will realize that patients
17 were the furthest thing from Janssen's mind when it came
18 to Risperdal.

19 So how did Janssen fail to live up to this
20 motto so poorly? To do that -- to answer that question,
21 we have to go back several decades and talk about some
22 history. We need to start back in the 1950s. At that
23 time, there were powerful drugs on the market which were
24 typically called tranquilizers. They were prescribed
25 for a variety of conditions: schizophrenia, but also

1 for conditions like insomnia or anxiety.

2 Now, one of the side effects of these
3 drugs was something called tardive dyskinesia or TD.
4 This is these uncontrollable tics or jerking movements.
5 These debilitating uncontrollable side effects could
6 sometimes be permanent. So because of that, doctors
7 started using these tranquilizers, which they then
8 started calling antipsychotics, only for serious mental
9 illnesses like schizophrenia. Janssen had a drug like
10 this called Haldol. It was actually invented by a guy
11 named Paul Janssen, who was the founder of Janssen.
12 Haldol was widely prescribed. And you know what? It
13 worked pretty well. It worked pretty well.

14 Now, in the late 1970s and '80s, many drug
15 companies, including Janssen, started on this quest to
16 find drugs, antipsychotic drugs, that would be better
17 and safer than the older drugs like Haldol. After all,
18 if a company could come up with an improvement, a real
19 improvement over Haldol, that would be a breakthrough
20 for people suffering from schizophrenia.

21 In the 1990s, Janssen claimed it
22 discovered just such a drug, Risperdal, also called
23 risperidone. Janssen planned to introduce this drug as
24 a breakthrough. And because they were going to claim it
25 was a breakthrough, they knew they could charge a lot

1 more money than these older drugs like Haldol, which had
2 become available in generic form. So months before they
3 got their FDA approval, Janssen had some marketing --
4 internal marketing plans within the company about how
5 they were going to launch their drug. Let's take a look
6 at it.

7 This is their strategic launch plan for
8 Risperdal in June of 1993, and they say, "A new
9 antipsychotic should offer less side effects (EPS)" --
10 that's related to this tardive dyskinesia or TD that we
11 talked about -- "combined with better efficacy ... when
12 compared to current neuroleptics," in other words, be
13 safer, better efficacy, work better.

14 Now, what else did their marketing plans
15 have in mind back in 1993? Well, they said this as
16 their competitive strategy: "We must convert as many
17 patients as possible from conventional neuroleptics" --
18 that's the older less expensive drugs -- "to Risperdal."
19 And then what do they say? "The ultimate objective is
20 to create the perception that Risperdal will be the new
21 gold standard in drug therapy." That was Janssen's plan
22 back in 1993 before the FDA had even approved the drug.

23 Let me talk for just a minute about the
24 Food and Drug Administration. One of the things the FDA
25 does is it tells drug companies what they can say about

1 their drugs. It tells them what they can say and who
2 they can market and promote their drugs to. A drug
3 company can have all the marketing plans they want, but
4 if the FDA says no, they're not allowed to promote for
5 those illnesses or in those populations, or at least
6 that's how it's supposed to work.

7 So you see in their marketing plan they
8 knew they had to claim this drug was going to be an
9 improvement, an improvement over the older drug. So
10 they asked the FDA back in 1993 for a package insert, or
11 the label, that would help implement the marketing plan
12 they laid out. The FDA told Janssen no, you cannot say
13 that Risperdal is better than Haldol.

14 In response, Janssen sent a letter to the
15 FDA arguing why they should be able to make that claim,
16 and look at what they said. They said, "Information
17 contained in the package insert," or the label, "can
18 have a significant impact on the sponsor's ability to
19 promote a new drug product." In other words, they knew
20 that they needed this label that said they were better
21 than the older drugs, because they wanted to be able to
22 promote it over the older drugs. The FDA did not agree
23 with this, and they told Janssen so very clearly. They
24 would not allow Janssen to make any claim that Risperdal
25 was better than Haldol, and let's take a look at what

1 the FDA finally said.

2 Well, let me back up. They had some
3 interior debate within the FDA about we can't -- they
4 won't agree to the label. Why are we having this debate
5 with Janssen? This is what the folks inside the FDA
6 said. They said, look, this is a delay that's happening
7 solely because of a sponsor's desire for labeling that
8 will facilitate promotion. In other words, we've done
9 our job; they just want a label that will allow them to
10 promote their product.

11 They didn't agree with that. The FDA said
12 no. What did the FDA tell Janssen? In the final
13 approval they said, "We would consider any advertisement
14 or promotional labeling for Risperdal false, misleading
15 or lacking fair balance ... that risperidone is superior
16 to haloperidol" -- that's Haldol -- "or any other
17 marketed antipsychotic ... with regard to safety or
18 effectiveness." In other words, you can't say it's
19 better. You can't say it's safer.

20 Janssen still pushed back, but the FDA
21 wouldn't budge. Here's an internal memo from the FDA
22 where they conclude that we have -- that the FDA "has
23 refused to accede to Janssen's demands because" what
24 they want -- what Janssen wants on the label "invites a
25 comparison that leads to the conclusion that Risperdal

1 has been shown to be superior to haloperidol when, in
2 fact, it has not." And they told them that plainly.

3 The FDA was the first group to tell
4 Janssen that Risperdal was no better than the less
5 expensive drugs, but it wouldn't be the last. You're
6 going to hear evidence in 2005, a government study
7 called the CATIE study, an independent study untainted
8 by drug company funding, reached the exact same
9 conclusion. We'll talk about that a little bit later.

10 So how does Janssen react to this bad news
11 back in 1993? Did they go back and rewrite their
12 marketing plans? Did they decide to abandon this plan
13 to create the perception that Risperdal was better than
14 the older drugs? Did they go back to the drawing board
15 and decide to follow the rules that the FDA had set?
16 They didn't. They didn't.

17 How did they react to this? Well, let's
18 take a look at the Risperdal business plan in the fall
19 of 1994, about eight months after the drug's approved.
20 What do they say? "Key Strategic Components: The
21 overall objective is to make Risperdal the new gold
22 standard for antipsychotic therapy and maintain the
23 market leadership position."

24 How were they going to position as the new
25 gold standard, that phrase we've heard before? Well,

1 here's what they say: "The position of Risperdal is the
2 only first choice antipsychotic due to its efficacy for
3 a broad range of symptoms, a safety and tolerability
4 profile unmatched by any other antipsychotic,"
5 unmatched, safer than any other antipsychotic, better
6 than any other antipsychotic.

7 So despite the FDA's clear statement that
8 it's going to be false and misleading if you claim that
9 Risperdal was better than Haldol, they plowed right
10 ahead with it. Janssen, the evidence will show, plowed
11 right ahead with their claims that Risperdal was better
12 and safer. Starting in 1994 and until generics became
13 available in 2008, Janssen and its sales representatives
14 made this false claim of superiority over and over again
15 throughout the country and right here in Texas and to
16 Texas Medicaid officials.

17 Now, why in the world would Janssen risk
18 doing exactly what they were told not to do? It's the
19 same reason many people do what they're not supposed to
20 do, and that's money. Let's take a look at the money
21 Janssen was making in just the first eight months that
22 Risperdal was on the market. This is from their 1994
23 plan. Risperdal has quickly established itself as the
24 market leader, 20 percent of the entire company sales,
25 eight months.

1 When the FDA approved Risperdal in 1993,
2 they didn't know something, and really no one knew this
3 until this lawsuit uncovered it, is that Janssen's plan
4 to claim that Risperdal was superior was really only a
5 small piece of their overall plan to turn Risperdal into
6 a blockbuster.

7 Why would they need a false scheme or a
8 fraudulent scheme to turn Risperdal into a blockbuster
9 drug? Two reasons. First, Risperdal is designed to
10 treat a very serious but very infrequent condition,
11 schizophrenia. Thankfully, it only affects about
12 1 percent of the adult population.

13 Second problem, this drug was very
14 expensive. It was 45 times more expensive than the
15 older drugs. So how in the world do you turn that drug
16 into a blockbuster under those circumstances? Well,
17 here's how you start. You start with a Risperdal
18 strategic reimbursement plan, which they created in
19 September of 1992. This is a year before Risperdal was
20 approved. And it talks about how Janssen was planning
21 to generate revenue from this very expensive drug, and
22 they focus specifically on who was going to pay for it.
23 And in their own documents, they concluded that 60 to
24 80 percent of all schizophrenia treatments are for
25 Medicaid, and that makes sense, because schizophrenia is

1 a very debilitating disease. Mean people who suffer
2 from it can't maintain jobs, so they end up relying on
3 the public sector. They knew that in order to turn this
4 drug into a blockbuster, they had to find a way to get
5 Medicaid to pay for it.

6 So one of their first plans was to gain
7 credibility for TMAP for Risperdal by developing what's
8 called a set of treatment guidelines that would favor
9 Risperdal over the older drugs and over the competition.
10 You're going to hear about this plan they carried out in
11 several stages.

12 Let me talk to you about treatment
13 algorithms or guidelines. Treatment guidelines or
14 algorithms are supposed to be steps that a doctor is
15 supposed to follow, try this first; if that doesn't
16 work, try this; if that doesn't work, try this. It
17 could be a good idea. But in this case, Janssen ended
18 up creating, funding and implementing treatment
19 guidelines that favored its own drug, Risperdal. You'll
20 see evidence that Janssen hired three doctors to draft
21 treatment guidelines, which Janssen referred to as the
22 Risperdal treatment guidelines. Publicly they were
23 called the expert consensus guidelines, or the
24 Tri-University Guidelines, you'll hear that evidence,
25 because the doctors were from three different

1 universities.

2 During the drafting process of these
3 guidelines, Janssen actually had input into the
4 questions to be asked the psychiatrists, the way the
5 guidelines would be framed and how they could be best
6 used to help market the drug. You'll hear that after
7 these guidelines were formed, these three doctors that
8 Janssen hired formed their own company called EKS. And
9 Janssen paid that company \$600,000 to go out all
10 throughout the country and promote these guidelines,
11 seemingly as an independent third party.

12 And additionally, you'll see that when
13 these guidelines were actually published, Risperdal was
14 the only new antipsychotic listed by name. That wasn't
15 an accident, and it wasn't the result of some great
16 scientific breakthrough. What do I mean by that? Well,
17 this is a 1996 presentation by the reimbursement team
18 within Janssen. The reimbursement team are not
19 scientists. They're people in charge of getting the
20 drug paid for. And in 1996, they listed some of their
21 accomplishments in the past year. And what was one of
22 the big ones? The Tri-University Schizophrenia
23 Treatment Guidelines, these guidelines I've just told
24 you about, the design, development and implementation.
25 So they took credit for them as a marketing and

1 reimbursement tool, not as a medical breakthrough.

2 Now, having these guidelines around was
3 not going to be enough to help Janssen turn the drug
4 into a blockbuster. As you saw in Janssen's documents,
5 they knew that Medicaid was going to be key for this
6 drug's success. And Janssen knew also that if it could
7 get this drug in a favorable position with the Medicaid
8 Program, it stood to make a lot of money. And the
9 Medicaid Program they chose, as you heard from
10 Ms. O'Keeffe, was Texas, one of the three largest in the
11 country. Texas was targeted by Janssen with visits from
12 those three doctors they hired, paying money to
13 implement the guidelines in Texas, and then payments to
14 Texas officials to help promote the guidelines within
15 Texas and throughout the country.

16 Now, you may hear Janssen say during this
17 trial, oh, no, Texas came up with these guidelines on
18 their own. Well, Janssen's internal documents tell a
19 different story. Take a look at this document way back
20 from February 1993 before the drug's even approved, an
21 internal marketing plan discussed within the company.
22 They talk about developing a model state program that
23 could be a successful guide to schizophrenia management
24 that could be promoted locally and nationally. So way
25 back in 1993, Janssen had targeted Texas as this model

1 state program.

2 You'll also hear from a man named Dr. Alec
3 Miller, who's one of the Texas officials involved with
4 Medicaid. And he will testify that Texas adopted the
5 Janssen guidelines 100 percent whole cloth, is the word
6 he'll use, at a meeting in September of 1996. In the
7 first version of the Texas guidelines -- and here they
8 are. This is what I mean by the different steps of
9 the -- it's called an algorithm or a set of guidelines,
10 and this is the first one, risperidone, so conventional
11 antipsychotic or risperidone. Now, it's in the first
12 category, it's the first choice, but it's equal to the
13 older less expensive medications. Now, Janssen thought
14 this was good. It put their drug up there. It gave
15 their drug credibility. It was going to allow them to
16 claim ultimately that Risperdal was superior to the
17 older drugs.

18 Take a look at an investor relations plan
19 that talks about these guidelines being published in
20 1996, and they say that we're going to publish these
21 guidelines and the use of them as standard of care and
22 thus, Risperdal as standard of care for schizophrenia.
23 So they knew back in 1996 when they were talking to
24 potential investors or writing about that, that this
25 guideline, this treatment guideline, was going to

1 position Risperdal as superior, which, of course, was
2 the exact thing the FDA told them they could not do.

3 But being on the same level as the older
4 drugs, of course, they wanted more. They wanted to get
5 a perception of superiority. So how did they do that?
6 Well, soon after the guidelines were adopted, the first
7 string of them, Janssen went back to Texas and
8 contributed money to get TMAP, the Texas Medication
9 Algorithm Project -- that's what they called it, TMAP,
10 the Texas Medication Algorithm Project -- implemented
11 throughout the state. All told, Janssen and its
12 charitable arm, the Robert Wood Johnson Foundation,
13 contributed over \$3 million to this Texas Medication
14 Algorithm Project. And soon after Janssen began these
15 contributions, soon after, along with other drug
16 companies that were coming out with their own newer
17 expensive drugs, the guidelines got changed by Texas
18 officials to put the older less expensive drugs farther
19 down on the list and to put the newer more expensive
20 drugs as the first choice. So a drug that was 45 times
21 more expensive was now going to be the first choice, and
22 the less expensive drug was going to be two or three
23 levels down. So in other words, they got TMAP, this
24 Texas program, to make the exact same claim that the FDA
25 had told them back in '93 they couldn't make.

1 Now, Janssen's own documents reveal what
2 they thought the financial link was between their
3 contributions to this Texas program and where Risperdal
4 got positioned. Here's an e-mail we uncovered from
5 July 2001 talking about the funding for this program.
6 And they say "One of the reasons Janssen committed
7 substantial funding for TMAP" -- that's the Texas
8 program -- "was to develop a treatment guideline for
9 schizophrenia that positioned atypicals as first line
10 agents (at the time, atypicals were usually positioned
11 after conventionals)." Atypicals, that's the newer more
12 expensive drugs; conventionals, the older less expensive
13 drugs. So they knew what the motivation for the money
14 was and they knew what they got.

15 Now, now does TMAP, do these guidelines,
16 do they represent objective medical opinion? You're
17 going to see evidence that will allow you to see for
18 yourself. Let's take a look at this exhibit, which is a
19 summary of all the different treatment guidelines that
20 were out there for schizophrenia in 1999. And this is a
21 little bit hard to read, but let me take you through it.

22 The guideline characteristic here is
23 first-line typical antipsychotics, in other words, were
24 the cheaper, less expensive ones the first line, the
25 first choice. In all of these other guidelines, the

1 ones developed by the American Psychiatric Association,
2 the Journal of Psychiatry, the Veterans Administration,
3 all of these, the cheaper older drugs were first line,
4 except for one, TMAP. The TMAP project, no. The first
5 line was the newer more expensive drugs.

6 Janssen's scheme, though, did not stop
7 with getting TMAP implemented throughout Texas. They
8 needed also to shove aside their competitors that also
9 had new drugs out there and truly be number one in
10 Texas. And to do that, they needed the help of certain
11 Texas officials. One of them that you're going to hear
12 about is Dr. Steven Shon. Dr. Shon was the medical
13 director for the Texas Department of Mental Health,
14 which means he had a lot of influence over the needy
15 Texans in need of mental illness treatment.

16 As you'll see in here, Janssen made a
17 series of illegal payments to Dr. Shon that effectively
18 turned him into a salesman for Risperdal. They even had
19 the man sign a consulting agreement in which he said
20 that he had no obligations that would interfere with his
21 obligations to Janssen. All the while, he was an
22 employee of the State of Texas subject to their ethical
23 rules.

24 What did Janssen get for its money? They
25 got the man to fly all over the country helping sell

1 Risperdal and helping sell the false idea that Risperdal
2 was better and safer than the older less expensive
3 drugs. And this chart represents all of the different
4 places Dr. Shon was paid to go by Janssen. He made
5 numerous presentations about the Texas Medication
6 Algorithm Project, TMAP, went to all these states to try
7 to sell that to their states.

8 One of the presentations he made was
9 pretty early on in October of 1997. It was an all-day
10 meeting to brief the drug companies who had contributed
11 to TMAP on how things were going. Well, it turns out
12 for Janssen, things were going pretty well, because a
13 percentage of patients in the mental health clinics for
14 schizophrenia patients who had been prescribed Risperdal
15 was 68 percent. That's a pretty good number for a drug
16 that is no better and no safer than the older less
17 expensive medications.

18 The doctors associated with TMAP also laid
19 out the philosophy of what the program was designed to
20 convey. And what do they say? The most efficacious and
21 safest treatments are supposed to be first. And what
22 were the most efficacious and safest treatments
23 according to the TMAP guideline? The newer more
24 expensive drugs like Risperdal. In other words, TMAP
25 embodies Janssen's claim that the FDA told them they

1 couldn't make that Risperdal was superior to the other
2 drugs.

3 In 2000 alone, Janssen paid Mr. Shon -- or
4 Dr. Shon to spend almost half his time, almost half his
5 time as a Texas employee on the road for Janssen selling
6 Risperdal. How did that help Janssen? Well, it got
7 other states to buy in to the program that they had
8 helped implement here in Texas. And by 2001, Janssen's
9 revenue for Risperdal alone, \$1.8 billion.

10 And the folks within Janssen, they knew
11 exactly who was responsible for that money. This is an
12 internal e-mail about the importance of Dr. Steve Shon.
13 What do they say? "Note: Dr. Shon can and is
14 influencing not only the \$50 million atypical" -- that's
15 the newer drugs -- "in Texas, but likewise in many other
16 states." And what's in all caps, not my all caps,
17 theirs? "We will not let Lilly or Pfizer" -- those are
18 two competitors -- "prevail with our most important
19 public sector thought leader." They knew they needed
20 Dr. Shon to help them keep up that 1.8 billion a year.

21 He wasn't the only Texas official, though,
22 that Janssen hijacked to help them promote Risperdal.
23 They also paid substantial sums of money to these
24 individuals: Dr. Crismon, Dr. Miller, Dr. Chiles and
25 Dr. Rush. Janssen used these doctors for their own

1 purposes, paying them in excess of \$250,000 to fly all
2 around the country at Janssen expense to spout Janssen's
3 claims of Risperdal superiority, claims they knew they
4 couldn't make.

5 I talked about a scheme to turn the drug
6 into a blockbuster. Janssen's scheme to fraudulently
7 market Risperdal and claim it was better and safer was
8 not going to be enough to turn the drug into a
9 blockbuster. Selling more drugs for schizophrenia alone
10 was not going to be enough for them to make \$34 billion.
11 They needed to expand the market. Let's look at what
12 they thought about this back in the early '90s.

13 They had been told by the FDA when the
14 drug was approved in 1993, pretty simple, "Safety and
15 effectiveness in children have not been established,"
16 period. Now, despite this clear statement that they
17 couldn't promote it for pediatric use, Janssen planned
18 to promote Risperdal for use in small children from the
19 very beginning and to use it for conditions like
20 anxiety, rebelliousness, attention deficit disorder and
21 things of that nature.

22 Now, in this document here, Janssen
23 identifies the problem I was just talking about. They
24 talk about the anticipated growth -- this is their
25 marketing plan. This is an interesting phrase. "The

1 anticipated growth of the antipsychotic market does not
2 create enough room for the Risperdal sales forecast."
3 In other words, there's not enough schizophrenic people
4 to sell Risperdal to to get our sales forecast hit. So
5 what do they say? We need to aggressively expand
6 Risperdal in other states, and that's going to be
7 mandatory. Now, what does that mean? That meant that
8 they were going to have to establish it as a broad-use
9 product. Again, this is in the fall of 1994. And what
10 does that mean? A critical success factor for them in
11 that market expansion -- they identified this back in
12 1994 -- was children, children.

13 Now, think about this. The success
14 they're talking about here was not a medical
15 breakthrough. It was a financial breakthrough. Janssen
16 knew that if it could sell -- push its drug on children,
17 it could help make the drug financially successful. So
18 after 1994, every single Janssen business plan you will
19 see will talk about targeting the vulnerable population
20 of children to sell Risperdal to.

21 I want to make it clear that these plans
22 were not just abstract ideas about how to accomplish a
23 certain financial goal. They had very specific medical
24 tools that they used. For example, in one of their
25 early marketing plans, not a medical analysis, what did

1 they say? They said, Well, you know what? We need an
2 oral solution. Why? Because it's easily mixed with
3 liquids, and that can be used for kids, because
4 everybody knows that kids don't like to swallow pills.

5 Liquid formulas alone weren't going to be
6 enough to push Risperdal onto the children of Texas. In
7 the same marketing plan where they talk about this
8 children being a critical success factor, they talk
9 about this. They talk about this idea of market
10 expansion by seeding the literature. What does that
11 mean? That means putting in articles out there in
12 publications that say favorable things about Risperdal.
13 Now, these weren't going to be articles that just popped
14 up in a random journal by an academic or a doctor.
15 These were going to be articles that Janssen had a hand
16 in writing. Janssen had an extensive seeding and
17 publication plan.

18 Now, you may have thought before this
19 trial that these articles were designed to uncover
20 scientific truths or solve important medical problems,
21 but that is not how Janssen viewed these studies, make
22 no mistake. They viewed them, the evidence will show,
23 as a vehicle for their marketing messages. What do I
24 mean by that? Well, let's take a look at this. You'll
25 see this in evidence.

1 This is a publication program status
2 report by a company that Janssen hired called Excerpta
3 Medica. This is a company they hired to help them seed
4 the literature with favorable studies about Risperdal.
5 They did this dozens of times. You'll hear from Janssen
6 employees that the topics of the articles and the
7 conclusions were decided before the authors were even
8 identified, before they even knew who was going to write
9 it. Let me show you what I'm talking about.

10 You'll see chart after chart like this in
11 this document. Here's a topic of an article: the
12 effectiveness outcome of Risperdal. Who's the author
13 going to be? Don't know. Who's the writer going to be?
14 Don't know. What's the statu? Well, Janssen's
15 developing the draft.

16 Down here, Risperdal Medicaid outcomes.
17 The author, well, we know who that is. It's someone
18 named Gianfrancesco, but who's actually writing it?
19 You'll find that EM stands for Excerpta Medica,
20 Janssen's own publication company. And even though the
21 FDA told Janssen you cannot promote for use in children,
22 what are they doing in their publication plan? Well,
23 let's have an article reviewing antipsychotics in
24 children that we will target at pediatricians.

25 The goal of these articles was not to

1 advance scientific learning. It was to advance
2 Risperdal. All you have to do is look at Janssen's own
3 internal documents. Here's a discussion among some
4 people editing a document within Janssen that's going to
5 be published, and they say, "Although we like to think
6 we develop these manuscripts for scientific purposes,
7 the real value is when a sales rep can reference them,
8 show them and present them."

9 The seeds that Janssen planted bore very
10 much fruit. By 2001, from Janssen's own files, children
11 accounted for one quarter of all Risperdal
12 prescriptions. In fact, Janssen employees decided that
13 it was so successful that they need to have a standalone
14 business plan to help them push Risperdal onto children.
15 Here is that plan. Here is the June 2001 business plan.
16 And this is where they evaluate their strengths and
17 weaknesses and threats, and let's review.

18 Well, what are the strengths in the child
19 and adolescent markets for Risperdal? Well, they're the
20 leader. And one strength is we've got that oral
21 solution, so kids don't have to take pills.

22 What's one of their weaknesses? Well,
23 there's that safety perception problem, EPS and TD,
24 tardive dyskinesia. Prolactin, we'll talk about that in
25 a minute. Weight gain. What's another weakness? It's

1 illegal. Lack of promotional platform/indication. In
2 other words, that's a fancy way of saying -- "current
3 clinical data does not meet FDA stated needs." That's a
4 fancy way of saying we can't do it, and that's a
5 weakness.

6 And what are the threats that they
7 identify in the third slide? Well, one threat is public
8 relations. Don't want anyone finding out. Adults might
9 be really upset that kids are getting this powerful
10 antipsychotic. And what's another threat? Regulatory,
11 legal and payers. And to me, the evidence will show, I
12 think that's the most disturbing, because instead of
13 viewing the regulators, the legal folks at FDA, and the
14 payers, the Medicaid people, as partners in protecting
15 this most vulnerable population, Janssen viewed that as
16 an impediment to their market share. They viewed it as
17 a risk of getting caught.

18 So one month later in July of 2001,
19 Janssen prepared another business plan for children.
20 And what do they say? We're going to remain the gold
21 standard in the C&A market. I want to make sure you
22 have a picture of what this means. Half of Risperdal
23 child and adolescent patients -- again, from Janssen's
24 own documents in July of 2001, half of them are under
25 age 13. I heard that, and I thought that says one

1 thing. What's the picture of that, though? That's half
2 their market for this powerful antipsychotic, was kids
3 under 13, 5 percent of the -- 5 percent, zero to six
4 years.

5 So how did Risperdal get to be the gold
6 standard? How'd they get to be the gold -- that's a
7 phrase they like to use. You'll see it in their
8 documents. How'd they get to be the gold standard?
9 Something called off-label promotion. What do I mean by
10 that? Well, you may remember that was discussed a
11 little bit in the jury selection. Off-label promotion
12 is this: Unless the FDA has given an approval for the
13 drug's use in a particular population or for a
14 particular illness, it is illegal for a drug company to
15 promote or sell that drug to that population or for that
16 illness. So in Risperdal's case, that means you cannot
17 promote, market or sell for use in children. Now, if a
18 doctor independently decides that they want to prescribe
19 a drug, they can still do that. That's different. But
20 the drug company can't push it on the doctors. That's
21 off-label promotion.

22 Now, the FDA said that, but this was not
23 news to the company. This was not news to Janssen.
24 You'll see a memo from Alex Gorsky, who at that time was
25 the president of Janssen and is now the number three man

1 in the company, the old Johnson & Johnson company. He
2 sent out a memo every year telling people within the
3 company, promotion of unsupported or off-label claims
4 are not only illegal, so we know they're illegal, but
5 they compromise the reputation of the company.

6 So just like Janssen did not heed the FDA
7 when they told them you could not promote to children,
8 they did not heed or follow their own internal policies
9 and they pushed Risperdal for children. In fact, you'll
10 hear evidence that in 1997, they tried to get the FDA to
11 approve an indication for children. What does the FDA
12 say? "There is an inadequate support for the changes."
13 "You have provided no data."

14 Now, they weren't sending the FDA all
15 these business plans and all their marketing ideas.
16 They were sending what they thought was scientific data.
17 And they say, consequently, it's not approved. Why?
18 Because what you're wanting to put in the label would
19 only "promote the use of this drug in pediatric patients
20 without any justification." Now, they had their own
21 justification. It was to make more money. But there
22 was no scientific or medical justification. The FDA
23 told them that.

24 So as early as 1994 then, you'll hear
25 evidence that Janssen pushed Risperdal for use in

1 children throughout Texas and elsewhere, and they talked
2 to Medicaid providers like Dr. Valerie Robinson, someone
3 you'll hear from. She's a child psychiatrist. She only
4 sees children. You'll hear testimony that between 1994
5 and 2003, a Janssen sales rep named Jeff Dunham called
6 on her 94 times. She was not the only -- was not the
7 only adolescent child psychiatrist that Janssen
8 targeted. Sales representatives throughout Texas were
9 pushing Risperdal for use in children to psychiatrists
10 all over the state. You'll see call notes, something
11 called call notes where the salespeople had to write out
12 their sales calls, time and again to child psychiatrists
13 pushing Risperdal.

14 You'll also see documents about sales
15 promotions. They tried to make this fun. They tried to
16 have sales contests and promotions within the company to
17 see who could sell the most Risperdal. You'll see this
18 memo in May of 2004. Abilify, that's a competitive
19 drug. You may have seen it advertised on television.
20 "Abilify is gaining ground with C&A" -- that's child and
21 adolescent -- "psychiatrists and we need to make sure
22 Risperdal is growing with this customer segment. Let's
23 make it happen." And you'll see evidence that their
24 aggressive marketing campaign worked.

25 How will Janssen respond to this? I'm not

1 sure, but I think they will say that in 2006 and 2007,
2 they did get a narrow approval from the FDA for a narrow
3 use in children, not broad use, not children generally,
4 and certainly nothing that would justify all the
5 off-label promotion they did from 1994 onward.

6 You heard Ms. O'Keefe talk about
7 diabetes, so I want to transition into that subject and
8 talk about what else was going on in 2001 when Janssen
9 was really gearing up to push this drug into children.
10 As Risperdal's use became more widespread, cracks began
11 to appear in the foundation, which I think you'll
12 conclude is what happens when your foundation is built
13 on deception. As so many patients, including children,
14 began taking Risperdal. Some serious and potentially
15 deadly side effects began to develop. One of them was
16 this tardive dyskinesia, this movement disorder, that
17 was one side effect.

18 There was another side effect I want to
19 talk to you about that Janssen concealed. It's called
20 hyperprolactinemia. Hyperprolactinemia. Prolactin is a
21 sexual hormone. Hyperpro -- and if you have elevated
22 levels of it, it can cause serious problems.
23 Hyperprolactinemia can result in premature breast growth
24 and lactation in girls. It can result in breast growth
25 and lactation in little boys. These were the types of

1 side effects -- these side effects were the kinds of
2 things that Janssen concealed.

3 One of the most serious ones, though, was
4 diabetes, a lifetime disease. It turns out that weight
5 gain is a risk when you take Risperdal and these other
6 antipsychotics, and that when you gain weight, that's a
7 risk factor for getting diabetes. So in May of 2000,
8 May of 2000, the FDA asked Janssen and all these other
9 drug manufacturers for all the information you have
10 about your drug and diabetes, because the FDA was
11 getting reports that people were developing diabetes
12 from taking Risperdal, and they wanted -- and other
13 antipsychotics, and they wanted to find out what was
14 going on.

15 It turns out Janssen knew quite a bit
16 about diabetes that they never shared with Texas or the
17 FDA. Janssen knew that weight gain was an issue back in
18 1999, a full year before the FDA asked for the
19 information. They had done a study called RIS-113. And
20 this study revealed that Risperdal when compared to
21 Zyprexa, another antipsychotic drug, that both drugs
22 caused medically serious weight gain. And on
23 September 9th, the executives -- 1999, the executives
24 became aware of this study within Janssen. And what did
25 they conclude? They say, well, this one may be of

1 limited value because, among other reasons, unusual
2 weight findings. You'll see that e-mail. Despite that,
3 they didn't include this study to the FDA when they
4 asked -- when the FDA asked for information about
5 diabetes. They didn't disclose it to Texas Medicaid
6 officials. And they didn't even disclose it to the FDA
7 a couple of years later when the FDA told them and all
8 the other new antipsychotic drug manufacturers that you
9 had to have a new kind of warning on your drug about
10 diabetes. Instead, Janssen kept telling the world that
11 Risperdal did not have a diabetes risk.

12 Let's go back to the very beginning when
13 we first started talking. This is that letter that they
14 sent out in November of 2003 that the FDA later
15 determined was false and misleading and made them send
16 out a correction letter to 600,000 doctors around the
17 country saying we lied to you. This is that letter.
18 And it says in the letter that Risperdal is not
19 associated with an increased risk of diabetes. So
20 they're telling people -- with full knowledge that there
21 was such a risk, they're telling people that there's
22 not.

23 So every scheme, no matter how successful,
24 eventually runs out of gas. And in 2005, the evidence
25 will show, Janssen's scheme began to unravel. The

1 National Institute of Mental Health -- it's a government
2 agency sometimes called NIMH -- did a long-term
3 comprehensive study of almost 2000 patients taking
4 Risperdal and other antipsychotics. It was called
5 CATIE, which I've got to read this. It stands for the
6 Clinical Antipsychotic Trials of Intervention
7 Effectiveness. We're just going to call it CATIE. And
8 CATIE concluded what? It concluded that after all this
9 study, untainted by any drug company marketing,
10 untainted by any seeding of literature, untainted by any
11 influence, CATIE concludes that Risperdal and the other
12 newer more expensive drugs were no better and in some
13 ways worse than the older drugs. A few months later
14 over in England, a study called CUTLASS -- I'm not going
15 to tell you what that stands for, but CUTLASS also
16 confirmed the results of the CATIE study.

17 This was bad news for Janssen. What did
18 they say about it in their internal e-mails after these
19 studies came out? Let's take a look at an e-mail with
20 some key executives within the company in December of
21 2005. They say, "Importantly ... the UK version of
22 CATIE (called CUTLASS) was presented, unfortunately
23 confirming the results of CATIE that atypicals are no
24 better than conventionals." In other words, the ones
25 that are 45 times more expensive are no better than the

1 other ones that are a lot less expensive.

2 This was unfortunate. It was bad news.

3 But you're going to hear evidence that Janssen tried to
4 undermine and criticize the CATIE study. They tried to
5 undermine and criticize the CUTLASS study in doctor's
6 offices, in Medicaid offices, all throughout the
7 country.

8 The results in CATIE, though, were not a
9 surprise to Janssen, really. And why do I say that?
10 Well, let me take you back to 1991. They did a study
11 called RIS-7, Janssen did, comparing Risperdal to
12 perphenazine, another older less expensive
13 antipsychotic. And what were the results of RIS-7? No
14 better, that Risperdal was no better than perphenazine.

15 So the CATIE results were a surprise to
16 the medical community because the drug company's
17 marketing had been so pervasive and so successful,
18 convincing everyone that it was a breakthrough, but
19 companies like Janssen knew well before that the drugs
20 were no better and no safer. They knew they weren't a
21 breakthrough. They knew they were not justifying their
22 45 times higher price.

23 So the evidence will show that Janssen
24 made false claims of superiority. The evidence will
25 show that Janssen illegally and uninterrupted promoted

1 the use of this powerful antipsychotic in children, that
2 Janssen made false claims of safety about the drug,
3 minimized side effects like diabetes and prolactinemia,
4 and that Janssen also made false claims that, hey, it's
5 a lot more expensive, but you're going to save money in
6 the long run. You're going to hear that that claim was
7 also false.

8 All these parts of the scheme violated the
9 Texas Medicaid Fraud Prevention Act. Why? Well, by
10 making false statements to and concealing material
11 information from Texas Medicaid officials, that is a
12 violation of the Medicaid Fraud Act. You'll hear more
13 about these Texas Medicaid decision-makers in the trial.
14 Briefly, these folks are in charge of making decisions
15 about what drugs go on the formulary in Texas and what
16 drugs can be reimbursed. Let's talk a little bit about
17 that.

18 In order to get a drug available to be
19 reimbursed by Texas Medicaid, you have to be on
20 something called the formulary. You have to participate
21 in what's called the Texas Vendor Drug Program. I know
22 there's a lot of acronyms. Sometimes that's going to be
23 called VDP. And Janssen submits an application to the
24 Texas Vendor Drug Program, and they certify that the
25 information contained in the application, that this

1 product is not now in violation of either federal or
2 state law. That's what they say. They made this
3 representation in 1994, and they made it six other times
4 when they got approval for new formulations of
5 Risperdal. Each time, this representation was false
6 because Risperdal was in violation of state and federal
7 law. As we discussed, Janssen was promoting Risperdal
8 for unapproved uses. They were trying to promote the
9 drug and did promote the drug for children. They made
10 off-label and illegal claims that the drug was superior
11 to the older less expensive medications. And so
12 Janssen's certification that they were in compliance
13 with the law was false.

14 But getting the drug on the formulary,
15 you'll hear, is really just the beginning here in Texas.
16 Janssen also had to make sure that even though they were
17 on the formulary to be reimbursed, that Texas didn't get
18 wind of any of these issues and put on restrictions,
19 reimbursement restrictions, or conditions that could
20 hurt Janssen. So Janssen frequently represented to
21 Texas Medicaid officials these same misrepresentations,
22 that Risperdal was better, that it was safer, and that
23 it was more cost-effective in the long run, that it had
24 a low risk of diabetes, that it didn't cause
25 hyperprolactinemia, all these things that Janssen knew

1 to be false.

2 Now, what will you hear from Janssen in
3 defense of this? Well, throughout the time this case
4 has been pending, we've heard a lot of attempts by
5 Janssen to excuse or justify their conduct. I submit to
6 you that the evidence will show that those are just
7 smoke screens. Those are smoke screens to conceal their
8 conduct.

9 But that's not just a characterization
10 that I make, all right? Let's look at an internal
11 e-mail between our friend Dr. Reines and a colleague at
12 the pharmaceutical research group of Johnson & Johnson.
13 This is an exchange they were having about some
14 communications that Janssen was about to make to the
15 public about the risk of stroke in the elderly for
16 taking Risperdal. There was a problem they uncovered
17 that it turns out that Risperdal was a stroke risk for
18 the elderly. That's what a CVAE is, a cardiovascular
19 adverse event. That's a stroke.

20 They were talking about how this data was
21 going to be shared with the public, and they were having
22 a debate about whether the data was going to be shared
23 accurately and truthfully. And Dr. Reines communicates
24 to his friend Fred, "I'm going to have to learn not to
25 trust their communications." And what does Mr. Grossman

1 say? "They just never stop spinning." And I don't
2 think they're going to stop spinning in the month of
3 January 2012 in Travis County, Texas.

4 Let me take a moment to preview what the
5 damages are going to be in this case. Texas Medicaid,
6 as you heard from Ms. O'Keefe, has been reimbursed
7 500 -- has reimbursed \$579.6 million worth of Risperdal.
8 Under that statute we just discussed, the Texas Medicaid
9 Fraud Prevention Act, Texas is entitled to that money
10 back because it was paid under false pretenses.

11 Now, there are other ways of measuring the
12 State's damages as well. We're going to bring you a
13 nationally-recognized healthcare economist, a woman
14 named Dr. Rosenthal, and she will also give you some
15 tools to help measure the State's damages and how the
16 State's been hurt.

17 Texas law also provides for penalties.
18 When you make false statements in the Texas Medicaid
19 Program, you can be penalized. Each false statement
20 carries with it a separate penalty. And the evidence is
21 going to show that Janssen made thousands and thousands
22 and thousands of false statements. For example, 18,000
23 of those letters that the FDA determined was false and
24 misleading went to Texas Medicaid doctors. So when you
25 add up the dollars in this case, it's going to be a

1 staggering amount of money. It's going to be hundreds
2 of millions of dollars. But that's not our fault.
3 That's Janssen's fault. Janssen is the one that created
4 those large numbers by its decades-long, illegal
5 marketing and promotion of Risperdal.

6 I'm about done. And before I finish, I
7 want to say just a couple things about the kinds of
8 evidence you're going to hear in this case. You've
9 heard a little bit about this from Judge Dietz. You'll
10 hear from witnesses who testify under oath, live
11 witnesses, and you'll hear that several different ways.
12 Sometimes you will hear from a live witness who will
13 come to court and give testimony. Sometimes, in fact,
14 quite a bit of times, you'll hear videotaped deposition
15 testimony. In this case in particular, it makes sense
16 for us to present a lot of testimony to you by
17 under-oath videotapes. And I think you might hear from
18 20 or so witnesses that way. Now, many of these
19 witnesses are former Janssen employees that we cannot
20 compel to come to Austin. Our goal will be to have some
21 live witnesses every day and a few videotaped witnesses.
22 For example, the first witness you'll hear from, maybe
23 after lunch, is from Thomas Anderson. He's a former
24 Janssen employee, and he'll explain how Janssen helped
25 create these treatment guidelines that favored Risperdal

1 and how they got those guidelines implemented in Texas,
2 in part, by making contributions here in Texas to make
3 that happen.

4 You'll also hear from expert witnesses.
5 These are people with special expertise who have been
6 retained by the Attorney General's Office in this case
7 or by Mr. Jones to help explain what happened. You'll
8 hear from a guy named Joseph Glenmullen. Dr. Glenmullen
9 has spent thousands of hours over a five-year period
10 analyzing medical studies and all the facts and
11 circumstances of Risperdal. You'll hear from Dr. Arnie
12 Friede, an expert in the FDA process, who will explain
13 to you how that works. You'll hear from Dr. Bruce
14 Perry. He's a child and adolescent psychiatrist, and
15 he'll tell you all about Janssen's illegal promotion of
16 Risperdal in children.

17 You'll hear from a man named Dr. Robert
18 Rosenheck. Dr. Rosenheck is actually one of the authors
19 of that CATIE study that debunked the myths that Janssen
20 had been propagating on the medical community. He'll
21 testify how Janssen's claim that Risperdal was more
22 cost-effective was phony. Those are a few of the
23 experts you'll hear from.

24 You'll also hear and see documents. A lot
25 of this case is going to be documents. You just saw

1 probably 30 or 40 of them in my opening, and you'll see
2 the whole document in evidence. Those are all documents
3 that we uncovered in this case. Those are all documents
4 that no one knew about before the State of Texas
5 intervened in this case and brought this case for
6 Medicaid fraud.

7 I want to end this morning by showing you
8 one final document. This is a letter that William
9 Weldon, who was the chief executive officer of the whole
10 company, that whole Johnson & Johnson company -- he's
11 the head man. He wrote this in November 2011 to a
12 newspaper that had written an article about some of the
13 events that you're going to hear about in this trial.
14 And what does he say? He says, "The events you are
15 writing about are a rehash of unfortunate issues that we
16 have acknowledged and addressed over the past few
17 years." "We don't claim to be perfect and we own our
18 mistakes. We would never put anything ahead of patient
19 health and safety." "We have accepted responsibility."

20 During this trial, you're going to get a
21 chance to hold Mr. Weldon to his pledge. You're going
22 to get a chance to evaluate whether Johnson & Johnson
23 and Janssen has acknowledged mistakes that they have
24 owned their mistakes, that they have never put anything
25 above patient health and safety and that they have

1 accepted responsibility. You'll get to evaluate whether
2 they've done that in this case, and I submit to you that
3 you ought to hold Mr. Weldon to his words.

4 Often in this country we can feel
5 powerless to combat the actions of large companies. Our
6 jury system empowers you like no other system in the
7 world to send a message to companies like Janssen, a
8 message to tell the truth, don't conceal it, a message to
9 to put patients first, not profits, and a message to
10 refuse to let -- refuse to let corporate greed feast on
11 taxpayer dollars. Thank you for your time.

12 THE COURT: I want the audience to stay
13 seated, and I would like the jury to retire for about a
14 ten-minute break. Thank you. We're in recess.

15 *(Recess taken)*

16 *(Jury not present)*

17 THE COURT: Mr. McConnico, did you want to
18 argue at all?

19 MR. McCONNICO: Oh, Your Honor, I think I
20 might.

21 THE COURT: Okay.

22 MR. McCONNICO: I'd like to take up the
23 argument at this time rather than wait.

24 THE COURT: Did you want any props?

25 MR. McCONNICO: I think we're going to
